

Security Awareness & Training (Solo Developer)

Summary

This application is developed and operated by a single individual. There are no employees or contractors.

Training approach

- The developer maintains ongoing security awareness through self-directed training and review of security best practices.
- Security topics reviewed periodically include:
 - Secure authentication and MFA
 - Secret management and credential rotation
 - Secure coding practices (input validation, least privilege)
 - Vulnerability management and dependency updates
 - Incident response actions and communication

Enforcement

- Security requirements are implemented as technical controls (e.g., authentication guards, MFA enforcement in production, secrets not stored in source control).
- Changes that affect security posture are reviewed and documented in lightweight change management notes.
